

# Global Conference on Measuring New Forms of Employment

Brussels, 4 - 5 July 2024

#MeasuringEmployment

# END OF THE ERA OF (HUMAN) MANAGERS?

## Future of algorithmic management

Session 3 – "Edge-of-the-knowledge"

Łukasz Sienkiewicz

Gdańsk University of Technology

# END OF THE ERA OF (HUMAN) MANAGERS? Future of algorithmic management

# Generative AI & algorithmic management

**Generative AI** is an umbrella term and describes a technology that is designed to simulate human cognitive abilities across a wide array of intellectual tasks by learning from a vast amount of data (Dwivedi et al., 2023)

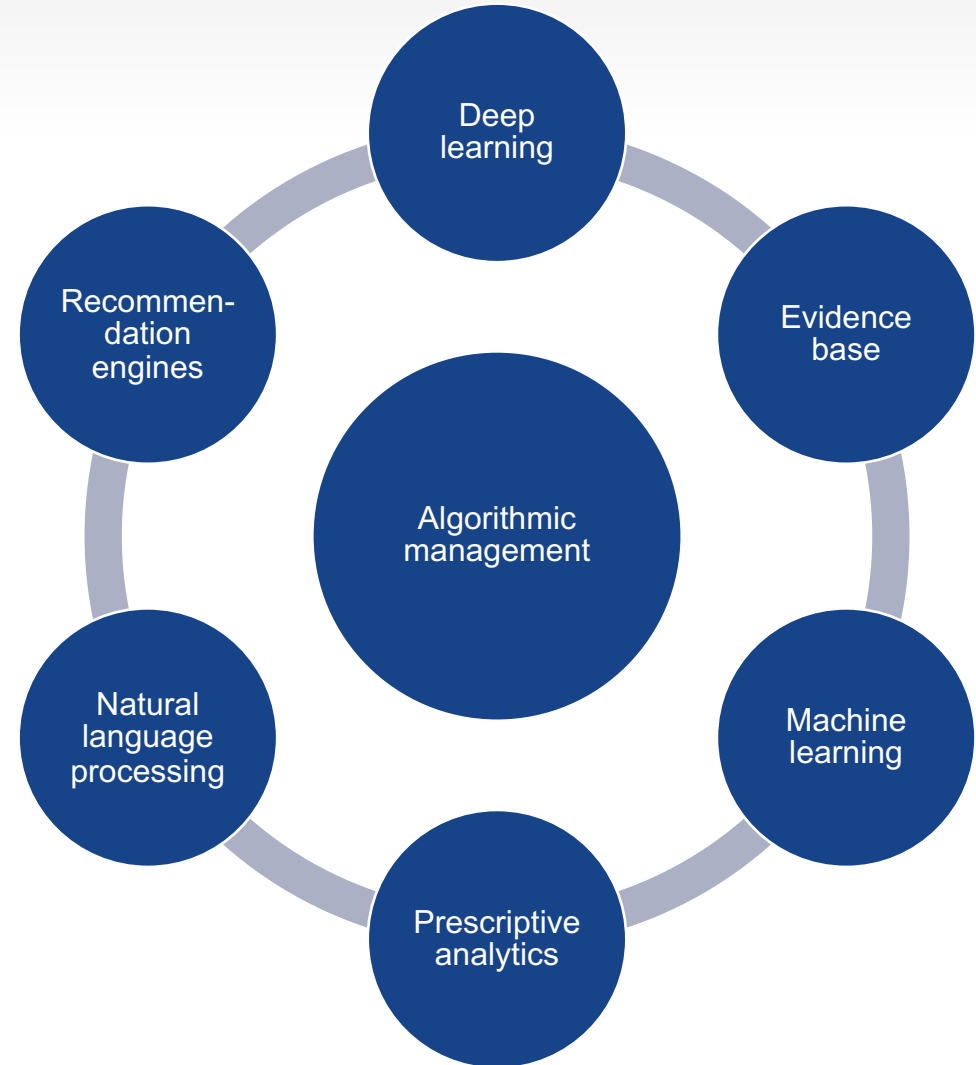

**Algorithmic management** is a control system in which self-learning algorithms are entrusted with the responsibility for making and executing decisions affecting work, thus limiting human involvement and supervision over the work process (Duggan et al., 2020) .

# Generative AI & algorithmic management

AI is a „family of families” of technologies.

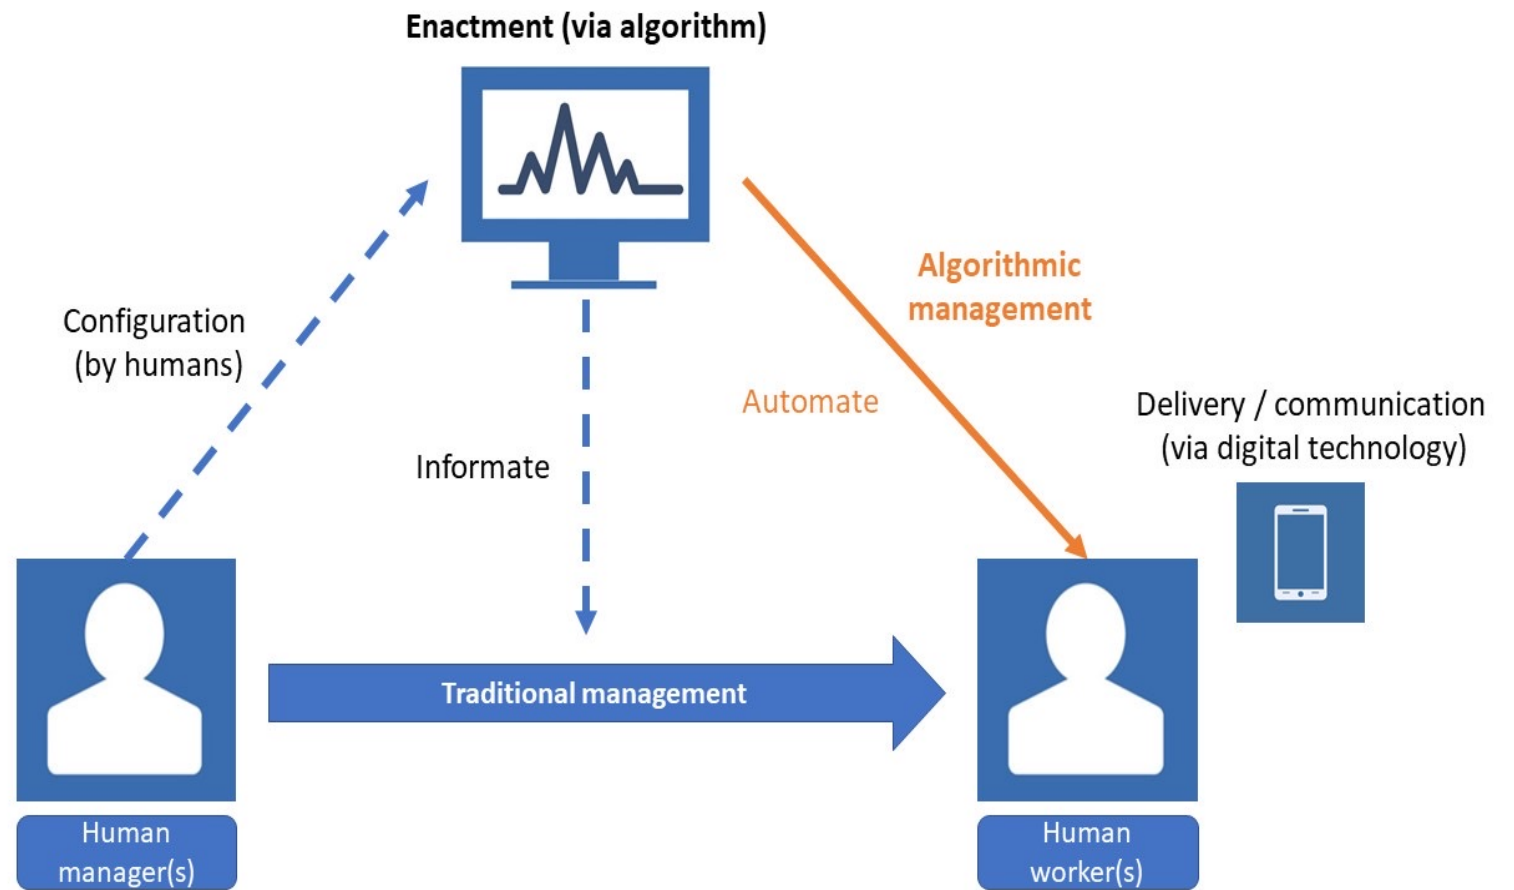

Also **algorithmic management** is based on number of AI and data science technologies, making it a nuanced technology.

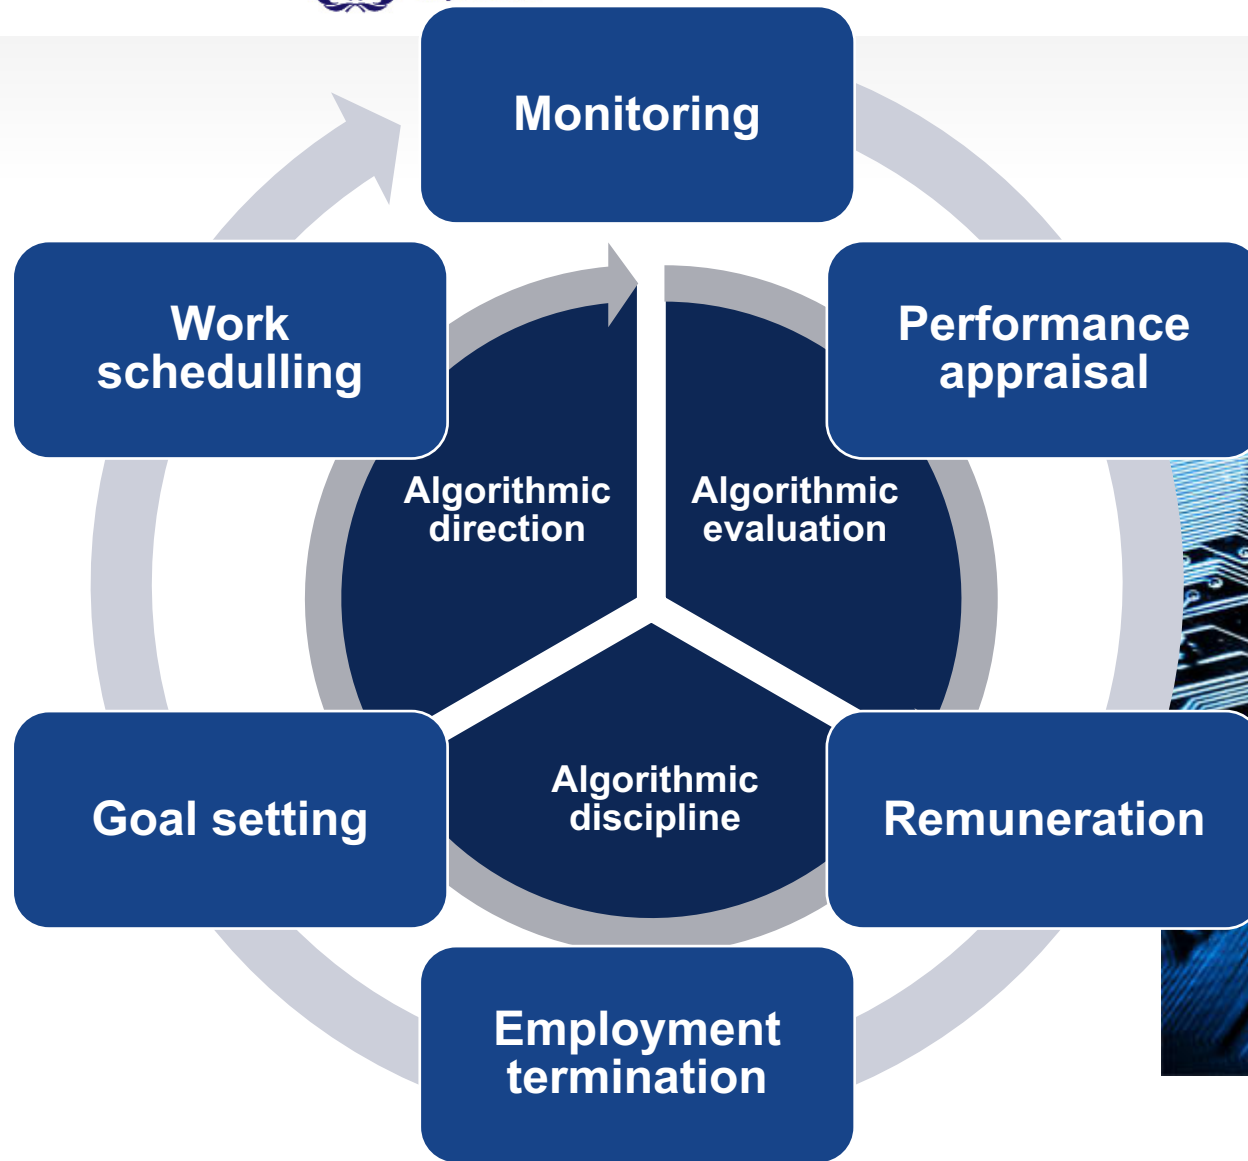

# Principles of algorithmic management

Not all data- or AI-supported actions can be considered algorithmic management!

The defining factor is the level of decision automation.

Source: adapted from Wiener et al. 2021

## What algorithmic „managers” actually do?

HRM process	HRM algorithm type		
	Descriptive algorithms	Predictive algorithms	Prescriptive algorithms
<b>Selection</b>	Assessment of job candidates personality traits on basis of their social media profiles	Predicting job candidates potential and performance	Automated resume screening; automated suggestions which job candidate to invite for job interview
<b>Training</b>	Automated web-search of available training programs; evaluation of training effectiveness	Predicting the need for upskilling; prediction of workforce competence gap	Automated instructions to poor performing workers
<b>Appraisal</b>	Sentiment analysis; aggregation and computing performance scores	Predicting when projects go off track; predicting future worker performance	Alerting managers to take corrective actions; Automated sanctioning (e.g. deactivation) of poor performing workers
<b>Compensation and benefits</b>	Automated salary surveying; job ranking	Predicting desired compensation level	Surge pricing; automated variable pay; priority access to work assignments
<b>Workforce planning</b>	Construction of competency profiles; employee inventory	Turnover prediction; predicting future labour demand	Automated staff rostering; automated staff allocation

# Benefits and challenges of algorithmic management

Lower costs  
Time savings  
Productivity gains  
Diminishing human bias  
Increasing (procedural and distributive) fairness  
Increasing consistency of decisions  
Increasing objectivity

Algorithm bias (unfairness, stereotyping, discrimination)  
Lack of (or limited) contextual information  
Inadequate data (input data – inaccurate, unrepresentative, biased)  
Lack of transparency (black box)  
Acceptance of algorithmic HR decisions  
Ethical considerations

## Other under-researched topics

- “Tech paradox” – if we outsource functions to tech we gradually lose ability to do it ourselves. What will be the scale of trade-off in managerial skills?
- “Youtubification” of management – will people question the source/ credibility of information?
- “External effects” - what will the negative effect be for workers (distrust, unethical/ counterproductive behaviours, work autonomy, job satisfaction, well-being, technostress, etc.)?
